

Project Specification Worksheet

A guide to help you organize your project requirements

How to use this worksheet: Fill out as much as you can. Even rough answers help developers give you accurate estimates. If you get stuck on a question, skip it and come back—or mention in your conversation with the developer that you need help with that section.

1. What problem are we solving?

A. Describe your current painful process. What happens now?

B. What should happen instead?

2. Who uses this system?

List user types (Admin, Employee, Manager, Customer) and what each needs to do.

3. What data are we tracking?

List your 'nouns' (Customers, Orders, Products) and key information about each.

4. What are the core workflows?

List 5-10 most common tasks. Format: 'When [user] needs to [do something], they should be able to...'

5. What reports or outputs do you need?

What questions are you trying to answer? Who needs to see what data? How often?

6. What existing systems must this connect to?

List software that must remain and any required integrations.

7. Timeline and budget?

Be honest about constraints. What's the cost of waiting 6 more months?
